IMPLEMENT CLIENT SCRIPT &UI POLICY [INCIDENT]

BRAINSTORMING & IDEATION PHASE

1. Introduction

The Brainstorming & Ideation Phase is an initial planning stage focused on analyzing functional requirements, defining user workflows, and outlining the architectural logic for Client Scripts and UI Policies within the ServiceNow Incident Management module. This ensures seamless user interactions and optimized form behavior before moving into execution.

2. Key Objectives

- **Requirement Gathering:** Identify mandatory, read-only, and visible field requirements across different incident scenarios.
- **Configuration vs. Scripting Strategy:** Determine when to leverage **UI Policies** (low-code/no-code approach) versus **Client Scripts** (onLoad, onChange, onSubmit).
- **User Experience (UX) Optimization:** Streamline client-side execution to ensure fast form loading times and an intuitive interface.
- **Data Integrity:** Implement robust client-side validations to minimize data entry errors.

3. Ideation & Identified Use Cases

A. UI Policies (Dynamic Form Control — No-Code)

- **State-Based Field Behavior:**
  - When State is set to **Resolved** or **Closed**, dynamically set **Resolution Code** and **Resolution Notes** to mandatory.
  - When State changes to **On Hold**, display the **Hold Reason** field and set it to mandatory.

.

  - **Category Dependency:** When Category is selected as **Hardware**, make the **Asset Tag** field visible and mandatory.
  - **Priority Handling:** Apply read-only locks or highlight visual indicators for high-priority incidents.

B. Client Scripts (Event-Driven Execution)

- **onLoad Script:**
  - Auto-populate logged-in user details in the **Caller** field upon creating a new Incident.
  - Lock or unlock sensitive fields based on the user's role during form initialization.

.

- **onChange Script:**
  - Dynamically filter and load **Subcategory** choices based on the selected **Category**.
  - Re-calculate the **Priority** field dynamically whenever **Impact** or **Urgency** changes.
  - Display a prominent visual alert/banner on the form when a **VIP User** is selected in the Caller field.

ld.

- **onSubmit Script:**
  - Validate that the **Description** field contains a minimum of 20 characters before form submission.
  - Trigger a confirmation modal dialog if specific keywords are detected in the **Short Description**.

.

4. Brainstorming Outcome & Best Practices

- **Performance First:** Prioritize **UI Policies** over Client Scripts wherever possible. For scripts requiring server data, utilize asynchronous GlideAjax or g_scratchpad to minimize form load lag.
- **Conflict Prevention:** Establish clear execution order and rules to prevent logical overlaps or loops between Client Scripts and UI Policies.
- **Structured Roadmap:** Clear triggers, conditions, and field actions have been mapped out to serve as a precise reference for the implementation phase.
