PROJECT TESTING PHASES

1. Introduction:

The Testing Phase is an important stage of the project where the implemented Client Scripts and UI Policies in the ServiceNow Incident module are tested to ensure that they work correctly according to the defined requirements.

2. Testing Objectives:

❖The main objectives of testing are:

- To verify that the Client Scripts work as expected.
- To check whether UI Policies correctly control form fields.
- To ensure that mandatory, visible, and read-only field conditions are working properly.
- To identify and fix any errors or unexpected behavior.
- To ensure that the Incident form provides the expected user experience.

3. Testing Process:

The Incident form was tested with different field values and conditions. The Client Script was executed by performing the required actions on the Incident form. The UI Policy was also tested to verify whether the specified fields became visible, hidden, mandatory, or read-only based on the configured conditions.

4. Testing Result:

The implemented Client Script and UI Policy were tested successfully in the Incident module. The configured conditions and field behaviors worked as expected. No major functional issues were identified during testing.
